

Features of Refrigerated Air Dryer

TAD

TXF

- EXCELLENT MOISTURE REMOVAL THROUGH FORCED CONDENSATION BY REFRIGERANT GAS.
- COOLING DEVICE NECESSARY FOR STABLE SYSTEM CONSTRUCTION.
- CONVENIENT INSPECTION OF OPERATION DUE TO A CONSTRUCTION OF GRAPHIC CONTROL PANEL, ON/OFF SWITCH, ON/OFF LAMP, REFRIGERANT GAUGE, AND AIR GAUGE.

### How to Order

#### I Refrigerated Air Dryer (TPC Air Dryer)

#### 2 Standard Size

Sign	Applied Air Compressor (HP)
5	5
7	7
10	10
15	15
20	20
30	30
50	50
75	75
100	100
150	150
200	200
250	250
300	300
400	400
500	500
600	600
800	800

#### 3 Rated Power

1	AC220V, 1Ø, 60Hz	TAD-5~TAD-100
2	AC220V, 3Ø, 60Hz	
3	AC380V, 3Ø, 60Hz	TAD-150~TAD-800
4	AC440V, 3Ø, 60Hz

- As standard R22 (Freon) is used for refrigerant gas, R22 or 134a can be produced to order for refrigerant gas, depending on models.

- Air processing capacity factor is based on Inlet Pressure 0.7 MPa (7.0 kgf/cm), Inlet Temperature 40 °C, Ambient Temperature 38 °C, and Operation Dew Point 4 °C.

- Model: Electronic trap (Direct-acting type) is basically attached to Model TAD-20 or higher for a complete discharge of condensate up to a very small amount.

- Rated-power products with special specifications can be produced to order.

- Air processing capacity factor is based on Inlet Pressure 7.0 kgf/arr, Inlet Temperature 38 °C, and Ambient Temperature 4 °C.

- Above products may be changed without prior notice due to technology development.

#### Functions of Air Dryer

### Basic Principles of Motion for Refrigerated Air Dryer

Warm and humid air enters AIR TO AIR HEAT EXCHANGER, not mixed with cold air. The cooled air condenses the saturated air to minimize heat load. The condensate is removed through drain, and the cooled air flows into AIR TO REF. HEAT EXCHANGER again to cool down to 4 °C - 10 °C. The moisture of the compressed air is separated by the impingement separator, and automatically discharged. The cool air is reheated by the warm air flowed in, and flows out through AIR TO AIR HEAT EXCHANGER. Reheat increases the volume of air, decreasing relative humidity.

### 1016

#### Considerations for Installation

Please read carefully the following before installing Air Dryer for extended use without breakdown.

- 1) Appropriate Places for Installation of AIR DRYER
  - 1 Flat place
  - 2 Place without acidic or alkaline substances
  - ③ Place without combustible gas
  - ④ Place easy for AIR piping and electric wiring
  - (5) Place without dust and vibration
- 6 Place easy to check and repair the product
- Place with appropriate ambient temperature in winter and summer (1.7℃ – 40℃)
- 2) Precautions for Installation
  - ① A minimum space of 1.5 M or more for the product shall be secured for sufficient fresh air and easy maintenance.
  - 2 The strength of the base for installation shall be considered before installation, and foundation work shall be done, if the ground is unstable.
- \* Places to Particularly Avoid

Slope, place with severe vibration, place exposed to direct sunlight, heated place, place exposed to rains, place with much dust and pollutants, place with bad ventilation, and place with standard service temperature (1.7 °C − 40 °C) unavailable.

- 1) If the temperature falls below 2 °C, the inside of DRAIN TRAP may be frozen.
- ② If the temperature rises above 40 ℃, AIR DRYER may stop working.

#### How to Lay Pipes

The assembly of pipes shall be adjusted, using tools such as a wrench, and piping shall be provided for sections with defective screws to prevent air leakage. If not fixed, the case may be damaged.

#### ※ Caution

Be sure to close BY-PASS VALVE while in use.

- ① The inlet and outlet of AIR DRYER shall be correctly connected in pipina
- 2 Be careful that the weight of piping is not loaded on the body.
- 3 Make sure that the vibration of AIR COMPRESSOR is not transmitted to DRYER, and avoid vertical piping.
- ④ Install a BY-PASS pipe between inlet and outlet of AIR DRYFR
- (5) For convenience purpose, union or flange shall be applied to the inlet and outlet of DRYER for connection.
- (6) Zinc-plated pipe shall be used.
- ⑦ The condensed water from the drain outlet shall be discharged to the outside through a separate drainpipe.

#### ※ Note

Since if the drainpipe is vertical or extended, pressure is produced in the pipe, the condensed water may not be discharged.

#### Method for Daily Operation

- 1) Press the operation switch.
- 2) The RUN lamp is lighted, and the refrigeration compressor is operated. 3) Check if the needle on the refrigerant pressure gauge indicates 2.5 -
- 3.5 kgf/cm² (R-134c) ~ 3.5 5.5 kgf/cm² (R-22). Allow compressor air to flow in 5 minutes after operation.

required.

#### Safety Device

For safe use, it has a safety device mounted. If the safety device functions, AIR DRYER stops automatically.

- 1) Electric Circuit: MOTOR PROTECTOR
- If over current flows in Refrigeration Compressor, MOTOR PROTECTOR works to stop AIR DRYER.
- 2) How to Release
  - ① Remove the cause of stop (see Causes of Failure and Measures)
  - Press the START button for operation.

## TXF

<ol> <li>Electric Wire The capacity of po</li> </ol>	wer cable is a	s follows.			T/					
Form	TAD-5~ TAD-100	TAD-100	TAD-150~ TAD-250	TAD-300~ TAD-400						
	1PH		3PH							
Rated Power	AC 220V	AC	220V/380V/440V							
	50Hz/60Hz		50Hz/60Hz							
Power Cable(mm <sup>2</sup> )	2.0 or	3.5 or more	5.5 or more							

2 A single-phase circuit breaker for wiring shall be installed for overload protection and to prevent an electric shock due to leakage before installing AIR DRYER.

- ③ Be sure to install Ground Cord. (Third-class grounding work is reauired.)
- ④ DRYER shall be operated within  $\pm 5$  % of the standard voltage to meet the rated power.

#### How to Operate

How to Wire

#### 1) Start-up

After installation is completed, start-up shall be provided after thoroughly checking the following.

#### Checkpoints

- ① Aren't there any problems in the installed air-pressure pipe and line?
- ② Is the valve of BY-PASS pipe closed?
- ③ Is the valve of Drain Discharge pipe opened?

#### Checkpoints for Power

- 1) Is voltage normal?
- 2 Isn't the capacity of fuse circuit breaker for wiring different from the designated.

#### 2) How to Operate

Press the ON button of the power switch.

- If the power lamp is lighted, operation starts. If the needle on the refrigerant pressure gauge indicates 2.5~3.5kgf/cm<sup>2</sup>(R-134c)~3.5~5.5kgf/cm<sup>2</sup>(R-22) in one minute after the refrigeration compressor has started to operate, it means a normal state.
- Improvement in 5 minutes after operation, compressed air flows in slowly while the air compressor is in operation. (Be careful that pressure is not loaded on AIR DRYER at once.)

% Note To restart after stop, an interval of 5 minutes or more is

## ٩D

#### Daily Checks and Cleaning

- 1) Daily Checks
  - 1 Check the Auto Drain Trap.
  - ② Check if the timer of Electronic Trap has been correctly set (ON 2 seconds, OFF 2 minutes).
  - 3 Check if there are any air leaks.
  - ④ Check if it works normally. (Check if water comes out.)
  - ⑤ Check inlet temperature for compressed air and ambient temperature, and clean Condenser and After cooler for the removal of dust on a regular basis.

#### 2) Cleaning

- ① Cleaning of Condenser
  - Clean the condenser on a regular basis, using a vacuum cleaner, a brush, or an air gun.
  - DRYER CASE shall have both sides disassembled one by one.
  - If dust is accumulated on the condenser, it is not only good for heat exchange, but also may stop the operation of AIR DRYER as Safety Device works, if severe.

#### Causes of Failure and Measures

If failure is suspected while using, please check the following.

#### ℁ Note

Be careful not to deform the fins of Condenser while cleaning.

- (2) Cleaning of Auto Drain Trap (Solenoid Valve)
  - Disassemble and clean the auto drain trap on a regular basis for a regular operation all the time.

#### Tips for Adjustment of Hot Gas Bypass Valve

 Since the hot gas bypass valve has been adjusted when shipped, it shall be adjusted only if abnormalities are found. Loosen the nut of the valve, and adjust the valve with a driver, seeing the refrigerant pressure gauge, until the needle on the refrigerant pressure gauge is within the normal scope.

#### Pressure Scope of Refrigerant R-22

- Low Pressure : 0.4~0.45MPa(4~ 4.5kgf/cm<sup>2</sup>)
- High Pressure : 1.3~1.75MPa(13 ~ 20kgf/cm<sup>2</sup>)
